

ISCC Certification of Biofuel Production

What is it?

The International Sustainability & Carbon Certification (ISCC) is an international certification program for biomass and bioenergy production that focuses on land use sustainability, traceability, and greenhouse gas verification along the complete supply chain.

Third-party certification to the ISCC system provides proof of compliance to the European biofuels market under the Renewable Energy Directive (RED) and Fuel Quality Directive (FQD). ISCC applies to any type of biomass-based fuel, from farmers producing the raw material to industrial production facilities.

Why you need it

ISCC certification is used around the world by businesses to sell biomass and biofuels into the EU market. It is approved for the EU RED and allows biomass and biofuel companies to sell products into Europe by satisfying applicable sustainability requirements.
